FOR IMMEDIATE RELEASE

Sheehy Mail Contractors tests new engine that will allow semi-trucks to operate cleaner than Tesla's Semi

(Waterloo, Wis., Dec. 5, 2017) – Sheehy Mail Contractors, Inc. (SMCI) is currently testing a new semi-truck engine that will allow commercial motor vehicles with compressed natural gas (CNG) engines to run on renewable natural gas (RNG), which produces the lowest carbon footprint out of any modern-day fuel.

Since June of 2017, SMCI has been testing the Cummins-Westport ISL G Near Zero (NZ) NOx natural gas engine in two semi-trucks. These trucks have been traveling to the East Coast daily while producing near zero emissions.

The engine itself has been optimized to operate entirely on natural gas which can be carried on the vehicle in either its compressed (CNG), liquefied (LNG), or even renewable (RNG) form. Currently, more than 92% of SMCI's total semi-truck fleet operates on CNG fuel with more than 12 million CNG miles being driven so far in 2017.

As the transportation industry continues to evolve technologically the type of fuel used to power semi-trucks can be expected to as well. "The mode of power will be the mode that has the lowest cost of operation including acquisition costs and has the most robust refueling/recharging system", said John Sheehy, CEO of Sheehy Enterprises.

However, SMCI believes that by combining the use of RNG fuel with the ISL G Near Zero engine semi-trucks can run cleaner on RNG fuel than on electric. Although electricity is a considered a "clean fuel", most of the electricity produced in the U.S is done so by consuming various fossil fuels such as coal. RNG fuel, however, can be produced naturally via biomethane from landfills, animal fodder, and even wastewater treatment facilities.

With so many advances being made in both trucking and fuel technology the future looks bright, and SMCI is excited to be at the forefront!
